

# Programmable authority for autonomous money.

Give agents economic autonomy without giving them unrestricted authority.

# Circle gives agents programmable money. Organizations still need control.

CIRCLE PRIMITIVES

- **Wallets** hold and sign
- **USDC** move stable value
- **Gateway** reach supported networks
- **x402** purchase machine services

ORGANIZATIONAL AUTHORITY

- Roles** who may act
- Policy** what may happen
- Approvals** where humans intervene
- Budgets** how much is at risk
- Emergency control** how autonomy stops
- Evidence** what can be proven

*The wedge is not another wallet. It is the layer that decides whether money may move—and preserves why.*

# The control foundation already works.

878 / 878

verification tests passed

- Role-level policy inheritance
- Credentialed hosted MCP
- Approval and spend controls
- Real Circle USDC execution
- Replay-safe paid HTTP
- Hash-chained evidence

MCP-only → 0.001 USDC → HTTP 200

# One policy follows the agent from intent to evidence.

Authorization is not enough.

Budget is reserved before execution and reconciled after the result.

# Built as an operating system, not a wallet wrapper.

- 01

Define authority

Roles, policy, budgets, approvals
- 02

Operate agents

Credentials, status, emergency control
- 03

Govern money

Treasury boundaries and execution state
- 04

Prove outcomes

Decisions, events, reconciliation, evidence

## TECHNICAL DIRECTION

# Circle-native infrastructure, designed toward Arc.

## CURRENTLY PROVEN

## NEXT NATIVE ENVIRONMENT

# Arc

USDC-native settlement · agent transactions · economic proof

Circle-supported compatibility proof

Base · Arbitrum · Polygon  
Optimism · Avalanche

*Current rails prove portability. Arc becomes the product's native economic environment next.*

# Next: make Arc the native execution environment.

**Milestone test**

A real agent purchases a service on Arc, stays inside an organizational mandate, and leaves a verifiable outcome trail.

# From agent control to economic operations.

AOPS becomes the organizational authority layer between autonomous agents and the economic services they use.

## NOW

### Governed execution

Policy · approvals · budgets · MCP · evidence

## NEXT

### Arc-native operations

USDC settlement · paid services · resilient control

## COMPANY

### Economic authority

Provider commerce · treasury orchestration · outcome proof

*Programmable money needs programmable authority.*
